Accuracy Report for MLP Model

Activation Function	Learning Rate	Epoch	#layers	#Hidden Nodes	Accuracy	Bias
sigmoid	0.01	1000	2	8,6	100%	disabled
tanh	0.01	1000	2	8,6	100%	disabled

The MLP classifier was evaluated using two activation functions: Sigmoid and Tanh, while keeping the other hyperparameters fixed.
Both models used a learning rate of 0.01, 1,000 epochs, two hidden layers containing 8 and 6 neurons, and no bias.

Conclusion:

Both activation functions achieved 100% test accuracy, indicating that the models correctly classified all samples in the test set.
However, the final training losses were different:
Sigmoid: 0.028179
Tanh: 0.002418
The loss curves show that Tanh reduced the training loss more quickly, while Sigmoid showed a more gradual decrease.
